Task-1

Goal

Understand Python file handling, automation logic, and exception handling.

Requirements

- Read and write files (txt/csv)
- Automate file operations (rename, move, delete)
- Use try-except for error handling
- Explain code logic in comments

Deliverables

1. Python script with proper comments
2. Sample input/output screenshots

Output Screenshots:

Students.csv

students.csv

```
id,name,age,marks
1,amit,20,85
2,neha,21,90
3,rahul,19,78
4,priya,22,88
```

1. Reading **students.csv** file and writing new data in it

```
import os
import csv
import shutil

# ------------------------------
# FUNCTION: Read CSV File
# ------------------------------
def read_csv(file_path):
    try:
        with open(file_path, 'r') as file:
            reader = csv.reader(file)
```

```
PS C:\Users\lenovo\OneDrive\Desktop\sanyukta\Alfido-Tech-Internship> & C:/Users/lenovo/AppData/Local/Programs/Python/Python314/python.exe c:/Users/lenovo/OneDrive/Desktop/sanyukta/Alfido-Tech-Internship/task1.py
Reading CSV File:

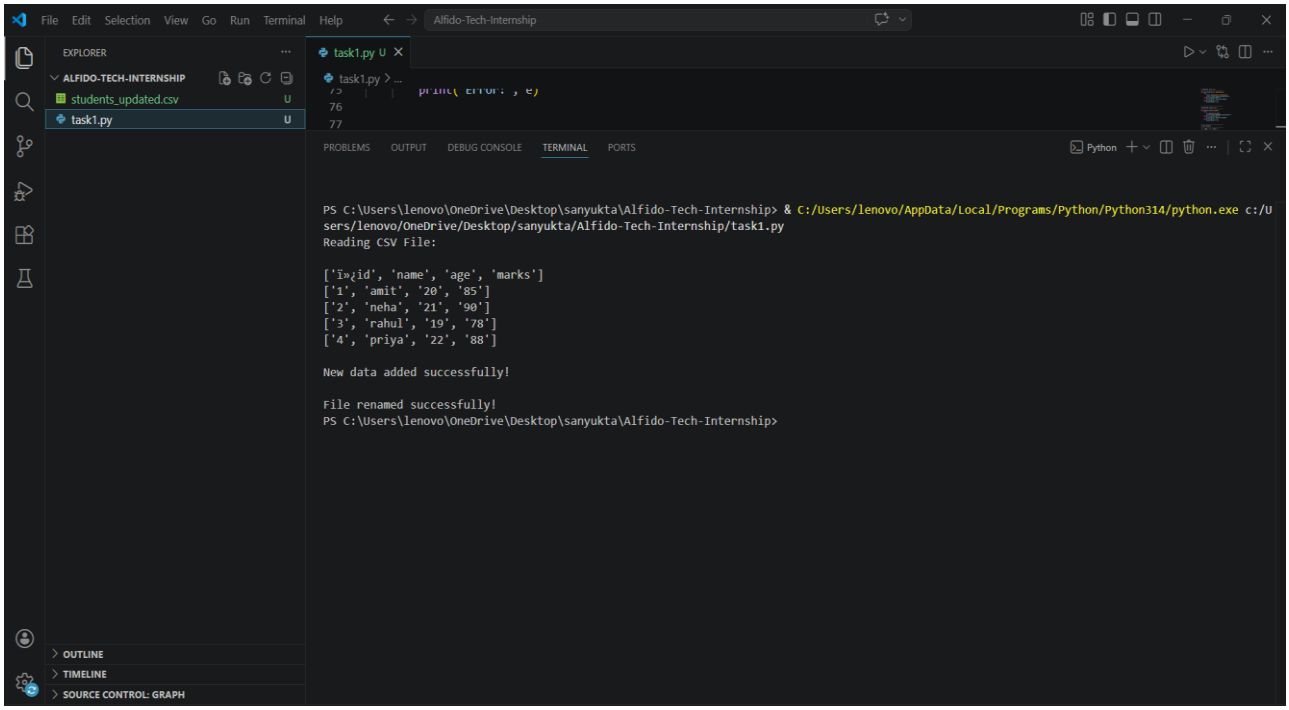
['ï»¿id', 'name', 'age', 'marks']
['1', 'amit', '20', '85']
['2', 'neha', '21', '90']
['3', 'rahul', '19', '78']
['4', 'priya', '22', '88']

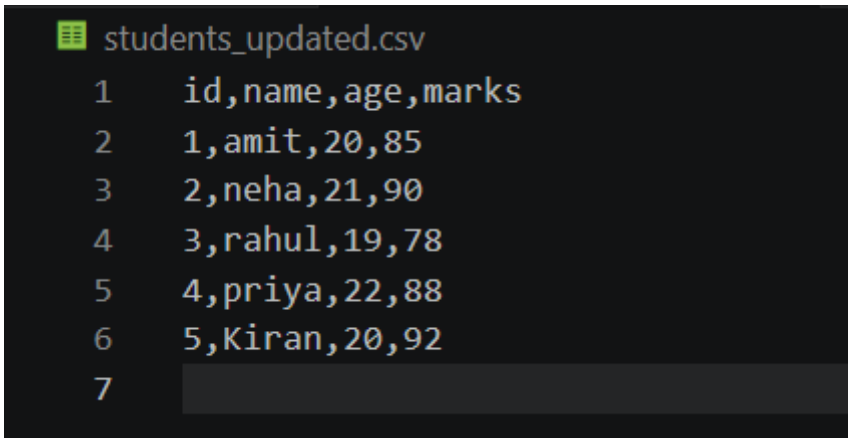
New data added successfully!
PS C:\Users\lenovo\OneDrive\Desktop\sanyukta\Alfido-Tech-Internship>
```

students.csv

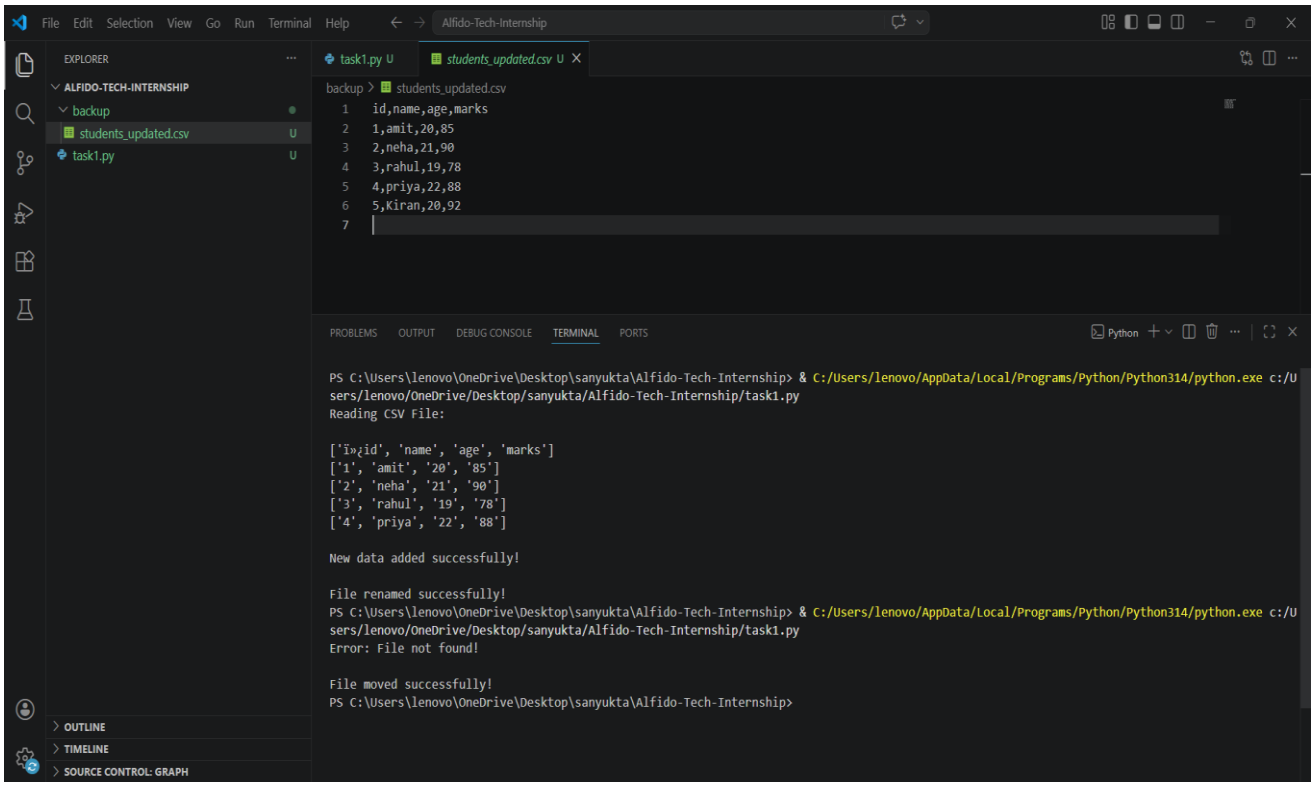
```
id,name,age,marks
1,amit,20,85
2,neha,21,90
3,rahul,19,78
4,priya,22,88
5,Kiran,20,92
```

2. Renaming file:
   students.csv → students_updated.csv

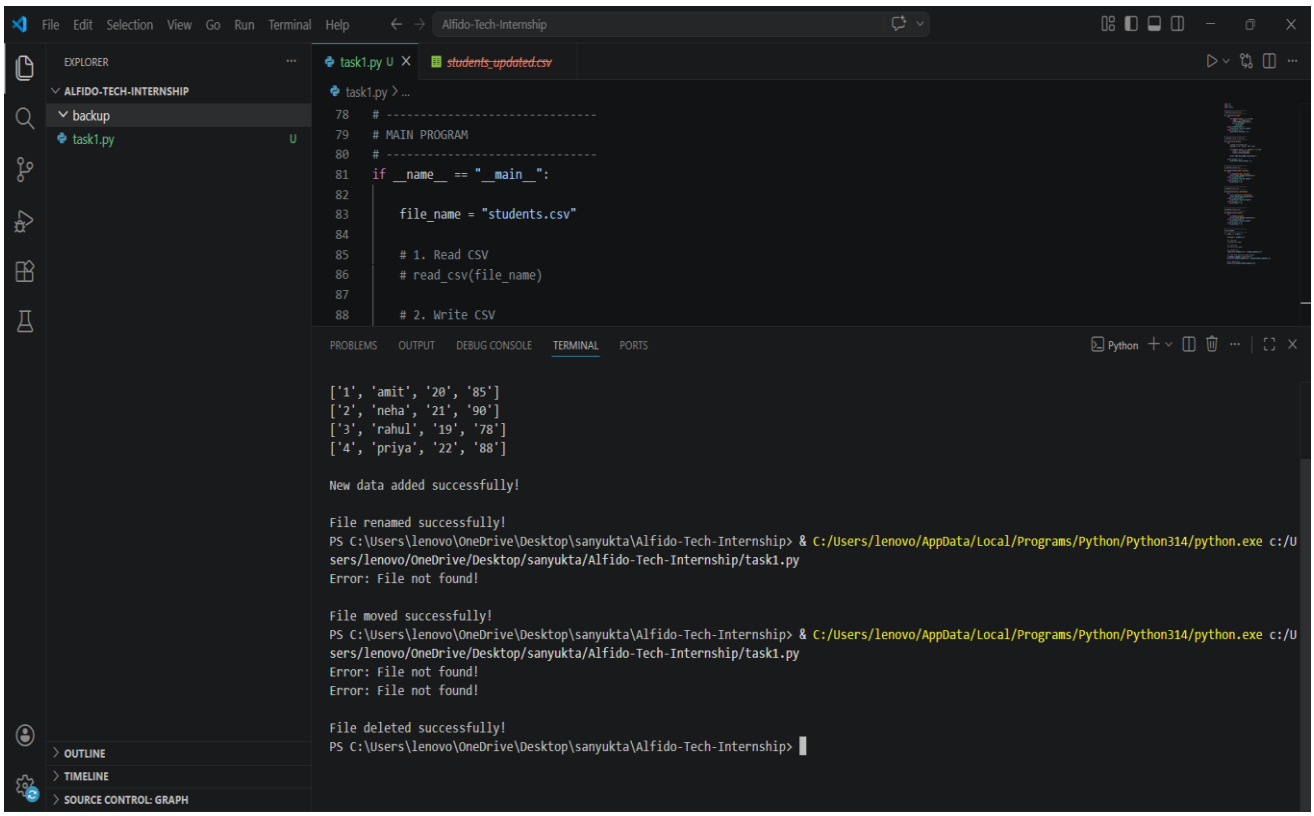




3. Move file



4. Delete File



Code:

```
import os
import csv
import shutil
# -------------------------------
# FUNCTION: Read CSV File
# -------------------------------
def read_csv(file_path):
    try:
        with open(file_path, 'r') as file:
            reader = csv.reader(file)
            print("Reading CSV File:\n")
            for row in reader:
                print(row)
    except FileNotFoundError:
        print("Error: File not found!")
    except Exception as e:
        print("Error occurred:", e)

# -------------------------------
# FUNCTION: Write to CSV File
# -------------------------------
def write_csv(file_path):
    try:
        # Adding new student data
        new_data = ["5", "Kiran", "20", "92"]

        with open(file_path, 'a', newline='') as file:
            writer = csv.writer(file)
            writer.writerow(new_data)

        print("\nNew data added successfully!")

    except Exception as e:
        print("Error while writing:", e)

# -------------------------------
# FUNCTION: Rename File
# -------------------------------
def rename_file(old_name, new_name):
    try:
        os.rename(old_name, new_name)
        print("\nFile renamed successfully!")
    except FileNotFoundError:
        print("Error: File not found!")
    except Exception as e:
        print("Error:", e)
```

```
# ------------------------------
# FUNCTION: Move File
# ------------------------------
def move_file(source, destination):
    try:
        shutil.move(source, destination)
        print("\nFile moved successfully!")
    except FileNotFoundError:
        print("Error: File not found!")
    except Exception as e:
        print("Error:", e)

# ------------------------------
# FUNCTION: Delete File
# ------------------------------
def delete_file(file_path):
    try:
        os.remove(file_path)
        print("\nFile deleted successfully!")
    except FileNotFoundError:
        print("Error: File not found!")
    except Exception as e:
        print("Error:", e)

# ------------------------------
# MAIN PROGRAM
# ------------------------------
if __name__ == "__main__":

    file_name = "students.csv"

    # 1. Read CSV
    read_csv(file_name)

    # 2. Write CSV
    write_csv(file_name)

    # 3. Rename File
    rename_file("students.csv", "students_updated.csv")

    # 4. Move File (make sure folder exists)
    os.makedirs("backup", exist_ok=True)
    move_file("students_updated.csv", "backup/students_updated.csv")

    # # 5. Delete File
    delete_file("backup/students_updated.csv")
```
